The global Molybdenum Evaporation Boat market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Thermal evaporation (resistance evaporation) is a coating method employed during physical vapor deposition. The material that is to form the subsequent layer is heated in a vacuum chamber until it evaporates. The vapor formed by the material condenses on the substrate and forms the required layer. Molybdenum boats share properties with their source material, either pure molybdenum or molybdenum alloy. These are formed from processed molybdenum plates that have undergone cutting, folding, riveting, and/or welding.
