## Abstracts

The global Molybdenum-Vanadium-Aluminum Alloy market size is predicted to grow from US\$ 31.04 million in 2025 to US\$ 71.97 million in 2032; it is expected to grow at a CAGR of 9.9% from 2026 to 2032.

Molybdenum-vanadium-aluminum alloys are intermediate or special alloy materials with molybdenum, vanadium, and aluminum as their main components. They are commonly used as alloying additives in titanium alloys, nickel-based alloys, and high-temperature alloys. These alloys can stably and uniformly introduce strengthening elements such as molybdenum and vanadium into the matrix material, while aluminum also helps improve the alloy's microstructure and properties. Molybdenum can improve the material's high-temperature strength, corrosion resistance, and creep resistance; vanadium helps refine grains and improve strength and toughness; and aluminum is often used to reduce density, improve oxidation resistance, and form stable phases. Therefore, molybdenum-vanadium-aluminum alloys are widely used in aerospace, military, energy equipment, chemical equipment, and high-end titanium alloy manufacturing, and are important alloying additives for producing high-performance structural materials and high-temperature resistant materials. Global sales in 2025 were approximately 665 tons.
