Monoclonal antibodies for primary hypercholesterolemia are a class of monoclonal antibody drugs that target proprotein convertase subtilis subtilis /kexin 9 (PCSK9). By specifically binding to PCSK9, they prevent its binding to the low-density lipoprotein receptor (LDL-R), thereby reducing the degradation of LDL-R, increasing the clearance of LDL-C, and significantly reducing the level of low-density lipoprotein cholesterol (LDL-C) in the blood. These agents are used primarily to treat adult patients with primary hypercholesterolemia, including heterozygous familial hypercholesterolemia and nonfamilial hypercholesterolemia, and mixed dyslipidemia.

United States market for Monoclonal Antibodies for Primary Hypercholesterolemia is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
