## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

A Monolithic Microwave Integrated Circuit, or MMIC (sometimes pronounced 'mimic'), is a type of integrated circuit (IC) device that operates at microwave frequencies (300 MHz to 300 GHz). These devices typically perform functions such as microwave mixing, power amplification, low-noise amplification, and high-frequency switching. Inputs and outputs on MMIC devices are frequently matched to a characteristic impedance of 50 ohms. This makes them easier to use, as cascading of MMICs does not then require an external matching network. Additionally, most microwave test equipment is designed to operate in a 50-ohm environment.

According to this study, over the next five years the Monolithic Microwave IC (MMIC) market will register a xx% CAGR in terms of revenue, the global market size will reach US\$ xx million by 2024, from US\$ xx million in 2019.
