A monophonic synthesizer is a type of synthesizer that is capable of producing only one note at a time. Unlike polyphonic synthesizers, which can play multiple notes simultaneously, monophonic synthesizers are restricted to playing single-note melodies or lines. Monophonic synthesizers typically feature a single oscillator or sound source, which generates the audio waveform used to create the sound. They may also include other essential components such as filters, envelopes, and modulation sources for shaping and sculpting the sound. Monophonic synthesizers are known for their simplicity and focus on creating rich, expressive sounds through intricate modulation and sound design techniques. While limited in their ability to play chords or harmonies, monophonic synthesizers are prized for their unique character, versatility, and ability to create dynamic and evolving sounds for a wide range of musical genres, including electronic, experimental, and ambient music.

The global Monophonic Synthesizer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
