Monopolar high-frequency coagulation devices are medical instruments used in surgical procedures to achieve coagulation, or clotting, of tissues using high-frequency electrical currents. Unlike bipolar devices, which have both active and return electrodes integrated into the same instrument, monopolar devices utilize a single active electrode that delivers electrical energy to the target tissue, while a separate return electrode is placed elsewhere on the patient's body.

The global Monopolar High-frequency Coagulation Devices market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
