The global Mooring Buoy market size is predicted to grow from US\$ 559 million in 2025 to US\$ 707 million in 2032; it is expected to grow at a CAGR of 3.5% from 2026 to 2032.

Mooring Buoy is a floating device used to moor and position vessels, platforms, floating facilities, or other marine structures. It is usually connected to the seabed through anchor chains, ropes, shackles, swivels, sinkers, or anchoring systems, providing a safe and stable mooring point for marine assets. Its core function is to provide a visible, connectable, and load-bearing floating structure on the water surface, enabling the target object to remain relatively fixed in a designated water area while withstanding combined loads from wind, waves, currents, vessel tension, and long-term corrosion in marine environments. The unit price of Mooring Buoy typically ranges from several thousand to tens of thousands of US dollars, with industry gross margins usually between 20% and 40%.

The upstream supply chain of Mooring Buoys mainly includes suppliers of steel, polyethylene, polyurethane foam, rubber, coating materials, anchor chains, ropes, shackles, swivels, connectors, lanterns, and reflective materials. The midstream segment consists of companies engaged in buoy design, float body molding, welding, foam filling, anti-corrosion treatment, load testing, and system integration. Downstream customers mainly include port and terminal operators, maritime authorities, offshore oil and gas projects, offshore wind projects, marine engineering contractors, marinas, aquaculture operators, and oceanographic research institutions. Since Mooring Buoys often need to be customized according to water depth, sea conditions, vessel type, load requirements, and mooring method, the supply chain relies not only on manufacturing capability, but also on engineering design, installation, and after-sales maintenance services.

The Mooring Buoy market is a typical marine infrastructure supporting segment, with demand mainly coming from ports, terminals, offshore engineering projects, navigation management, marinas, offshore energy facilities, and temporary mooring applications. This market is not characterized by high-frequency consumption, but is mainly driven by project construction, replacement of existing facilities, maintenance demand, and upgrades in marine safety requirements. With increasing emphasis on port operation safety, offshore energy development, and refined marine traffic management, market demand is expected to remain relatively stable. However, product pricing and profitability are strongly influenced by material specifications, buoyancy capacity, weather resistance, certification requirements, and the complexity of the associated mooring system. Future competition will increasingly focus on product reliability, customization capability, delivery efficiency, certification qualifications, and long-term maintenance services.
