The global Motor Protection Devices market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Motor Protection Devices (MPDs) are electrical components designed to safeguard motors from various potential hazards that could lead to damage or failure. These hazards might include:

Overload: When a motor is subjected to excessive current, often due to heavy loads or mechanical problems.

Short Circuit: An abnormal electrical connection that allows excessive current to flow, potentially damaging the motor or other components.

Phase Loss: When one or more phases of the power supply to the motor are lost, causing unbalanced operation and potential damage.

Overheating: Excessive temperature rise due to factors such as overload, bearing failure, or inadequate ventilation.

Ground Fault: When a portion of the motor's current flows to ground, posing a safety risk and potentially damaging the motor.

MPDs are essential for ensuring the safety and reliability of electrical systems, particularly those that rely heavily on motors, such as industrial plants, commercial buildings, and transportation infrastructure.
