The motor transmission rod refers to the mechanical connecting rod between the motor and the transmission device (such as gearbox, chain, belt, etc.). It is usually used to convert the rotational motion of the motor into linear motion or rotational motion, and transmit it to the equipment or mechanical components that need to be driven. The motor transmission rod is usually made of metal materials (such as steel, aluminum, etc.) and has a certain strength and rigidity to ensure the stability and reliability of the transmission. The design and size of the transmission rod will be determined according to the specific application requirements and transmission method. For example, a transmission rod that needs to be converted into linear motion may use a structure such as a screw or a slider.

The global Motor Transmission Rod market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
