Motorcycle Chain Aftermarkets are part of the drive train to transmit the motor power to the back wheel. Properly lubricated chains can reach an efficiency of 98% or greater in the transmission. Unlubricated chains will significantly decrease performance and increase chain and sprocket wear. The transmission chain of a motorcycle is an important component that connects the engine and the rear wheel. It is responsible for transmitting the power of the engine to the wheels, thereby driving the motorcycle. The transmission chain is usually composed of metal links. The chain passes through the gears (sprockets) of the engine and the gears (drive gears) of the rear wheel, and the power is transmitted through the rotation of the chain. This design allows the motorcycle to effectively transmit power at different speeds, and compared with other transmission systems, such as belt drives or shaft drives, the transmission chain has its unique advantages in terms of high performance requirements and maintainability. As the motorcycle is used for a longer time, the transmission chain will gradually lose its performance due to wear and tear and needs to be replaced regularly. In addition, under extreme conditions of use (such as high speed, heavy load, bad road conditions, etc.), the transmission chain may need to be replaced more frequently. As a key component of the transmission system, the performance and life of the motorcycle transmission chain directly affect the driving stability and safety of the motorcycle. Therefore, regular maintenance of the transmission chain (such as cleaning, lubrication, adjusting the tightness, etc.) is an important measure to maintain the performance of the motorcycle.

The global Motorcycle Chain Aftermarket market size is projected to grow from US\$ 1180 million in 2024 to US\$ 1282 million in 2030; it is expected to grow at a CAGR of

1.4% from 2024 to 2030.
