Abstracts

The global Motorcycle Electronically Controlled Suspension market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Motorbike electronically controlled suspension (e-suspension) adopts advanced electronic control technology, which is able to adjust the suspension parameters in real time according to the road conditions and driving needs, in order to improve riding comfort and vehicle handling performance. Due to its technical complexity and high performance characteristics, the market price of electronic suspension is relatively high. BMW, Ducati and other high-end models using ?hlins electronic suspension market average price of more than 5,000 U.S. dollars. KYB, Showa and other semi-active electronically controlled suspension market average price of 2,000-5,000 U.S. dollars. The upstream key components of motorbike electronically controlled suspensions include sensors, controllers, electro-hydraulic or electromagnetic actuators and high-strength, lightweight materials such as aluminium alloys and carbon fibre. Downstream customers are mainly motorbike manufacturers (OEMs) and the aftermarket.

Today the majority of new cars in the luxury and upper middle class range, including some Sport Utility Vehicles (SUVs) , have air suspension. The volume of the air in the air cushions in all corners of the car can be controlled. This is done by controlling the flow of the air in and out of the additional air reservoirs. The system includes a special air compressor, one or two air reservoirs, four shock absorber units with air springs and traditional shock absorbers, 2 to 5 stand-alone accelerometers and the electronic control unit (ECU) .
