The two-wheel shock absorber of a motorcycle is a vital component of the vehicle's suspension system. It is used to reduce the bumps and vibrations caused by uneven ground during driving, and improve riding comfort and stability. These shock absorbers usually use hydraulic or pneumatic working principles, where hydraulic shock absorbers absorb energy through the damping of oil, while pneumatic shock absorbers use gas compression to achieve a shock absorbing effect. Some high-end motorcycles may also be equipped with electronically controlled shock absorption systems that can automatically adjust the working status of the shock absorbers based on vehicle speed, road conditions and rider behavior to provide a more precise and comfortable suspension effect.
