## Abstracts

The global Motorised XY Stages market size is predicted to grow from US\$ 424 million in 2025 to US\$ 646 million in 2032; it is expected to grow at a CAGR of 6.2% from 2026 to 2032.

In 2025, global motorized XY stage production reached approximately 79 k units, the average price is 5500 usd/unit. The motorized XY stage is based on non-contact linear motor direct drive. Linear motors are frictionless, wear-free, and provide high acceleration and excellent speed control over a wide dynamic range. Ideal for a variety of precision positioning applications requiring mechanical or optical double-sided access.

### Market Concentration and Key Players:

Internationally, the market concentration of electric XY stage is relatively high, mainly concentrated in developed countries such as Europe, America and Japan. For example, large manufacturers such as Physik Instrumente and Dover Motion; from the domestic point of view, there is still a lot of room for development of the electric XY stage.

### Manufacturing Processes and Market Trends:

The core of the manufacturing process of the electric XY stage lies in the realization of micro-level or even nano-level precision motion control. Its basic structure usually adopts high-rigidity aluminum alloy or steel frame to ensure stability. The core motion module relies on precision guide rails and lead screws or linear motors to form a drive system, and integrates grating rulers or encoders to achieve closed-loop feedback to ensure positioning accuracy. For example, the positioning accuracy of high-end models can reach  $\pm 0.4$  microns, and the repeated positioning accuracy can reach  $\pm 0.1$  microns. The process needs to be optimized to suit different application scenarios, such as dust

and noise reduction covers and creep-resistant cross-roller bearings in semiconductor inspection to maintain clean environments and long-term accuracy, while in life science scenarios such as live cell imaging, compact designs such as cable linkages reduce volume and are compatible with incubator environments. Cable management, limit protection mechanisms and modular assembly processes are also key to ensuring reliability and consistency in mass production.

Market trends show that the demand for electric XY stage is continuing to grow with the automation upgrade of high-end industries such as semiconductors, electronics manufacturing, new energy and biomedicine, and the global market size is expected to maintain considerable growth. Technological development is moving towards higher precision, faster speed and intelligent integration. Direct drive linear motor technology has gradually replaced the traditional rotating motor combined with lead screw structure, significantly improving dynamic response performance. At the same time, the introduction of artificial intelligence algorithm enables the stage to carry out autonomous path planning and real-time error compensation, further improving the automation level. The downstream application field continues to expand, and has become a key equipment in high-precision operations such as semiconductor chip testing and packaging, new energy battery sorting, biomedical cell imaging, etc. The future competition will focus more on the provision of technology integration capabilities and customized solutions, especially in the frontier fields of 10,000 watt laser processing and micro-nano manufacturing, which puts forward higher requirements for the thermal stability, signal feedback speed and synergy with the overall system of the stage.
