The biggest difference between a racing gearbox and a civilian gearbox is the design and setting of the gears. Generally speaking, civil gearboxes are designed with an oblique opening and are designed with 'copper teeth' (Schrol) so that they can be accessed from the side when shifting. The racing gearbox is completely different. It uses a straight-open design, and the technical gear action must rely on the number of engine revolutions to coordinate entry. When shifting gears, the number of revolutions of the engine must not be lower than a limit, where the A group car is about 7000 rpm, and the N group car is about 5500 rpm
