Mouth ulcers, also known as canker sores, are normally small, painful lesions that develop in mouth or at the base of gums. They can make eating, drinking, and talking uncomfortable. Mouth ulcers aren’t contagious and usually go away within one to two weeks. Most ulcers will heal completely without any intervention. Treatment can range from simply smoothing or removing a local cause of trauma, to addressing underlying factors such as dry mouth or substituting a problem medication. Maintaining good oral hygiene and use of an antiseptic mouthwash or spray can prevent secondary infection and therefore hasten healing. A topical analgesic may reduce pain. Topical (gels, creams or inhalers) or systemic steroids may be used to reduce inflammation. An antifungal drug may be used to prevent oral candidiasis developing in those who use prolonged steroids In this report, the mouth ulcers treatment drugs include mouthwash, gel, spray, and lozenge. The drug classes in this market are corticosteroid, anesthetic, analgesic, antihistamine, and antimicrobial.
