Moving skates are also known as moving dollies or moving rollers. They are used in a range of industrial contexts such as manufacturing factories, warehouses, shipyards and fabrication sites to move heavy equipment and loads over short distances and manoeuvre them in the correct orientation into the desired space. They need to be used in conjunction with lifting equipment such as hydraulic toe jack, cranes or forklifts. This latter equipment raises the load, so that the skates can be fitted underneath and then lowers the load onto them at the start of the journey. The process is then reversed when the load reaches its destination.
