The global MPO-jumper market size is predicted to grow from US\$ 2887 million in 2025 to US\$ 5142 million in 2032; it is expected to grow at a CAGR of 9.0% from 2026 to 2032.

MPO-jumper are high-density fiber optic connection components that use multi-core push-in connectors. They integrate 12, 24, or higher core count optical fibers into a single cable, primarily used in data centers and high-speed interconnect scenarios to achieve multi-channel parallel transmission and high-density cabling. Global sales in 2025 were approximately 9,800 kilometers, with an average unit price of approximately US\$30.11 per kilometer, a capacity utilization rate of approximately 78%, and a gross profit margin of approximately 28%. The upstream mainly consists of suppliers of fiber optic preforms, optical fibers and cables, connectors, and precision structural components; the midstream consists of manufacturers of optical communication components and cable assemblies; and the downstream is concentrated in data center operators, telecom operators, cloud computing vendors, internet companies, and equipment manufacturers. In the product cost structure, fiber optics and connectors account for approximately 55%, labor and manufacturing costs account for approximately 20%, and equipment depreciation accounts for the remaining 20%. The costs of old and energy consumption account for approximately 10%, testing and yield loss for approximately 5%, and other auxiliary materials and management costs for approximately 10%. On the demand side, the downstream demand list includes hyperscale data centers, AI computing power clusters, 5G bearer networks, cloud computing infrastructure, and enterprise network upgrades. The downstream customer list includes cloud service providers, telecom operators, internet platform companies, data center integrators, and communication equipment manufacturers. On the business opportunity side, policy-driven factors come from the continuous advancement of computing power infrastructure and digital economy construction. Technological innovation-driven factors come from the development of 800G and above high-speed

optical modules, silicon photonics, and high-density cabling technologies, which drive the demand for core kilometers. Changes in consumer demand are reflected in the continuous growth of higher bandwidth, lower latency, and higher cabling density, thereby driving MPO fiber optic patch cords to upgrade towards high core count, high speed, and standardized modules.
