Minimal residual disease (MRD) refers to the small number of cancer cells that remain in the body after treatment. The number of remaining cells may be so small that they do not cause any physical signs or symptoms and often cannot even be detected through traditional methods, such as viewing cells under a microscope and/or by tracking abnormal serum proteins in the blood. An MRD positive test result means that residual (remaining) disease was detected. A negative result means that residual disease was not detected. The most widely used tests to measure MRD are flow cytometry, polymerase chain reaction (PCR) and next-generation sequencing (NGS).
