Abstracts

The global MRI 3T Cochlear Implant market size is predicted to grow from US$ 847 million in 2025 to US$ 1653 million in 2032; it is expected to grow at a CAGR of 10.2% from 2026 to 2032.

In 2024, the global production of MRI 3T Cochlear Implant will reach 91,900 sets, with China reaching 11,000 sets, with an average selling price of US$8,571.42 per set and a gross profit of approximately 62.56%-72.5%. The external sound processor converts sound signals into electrical signals, which are then transmitted to the internal implant, directly stimulating the auditory nerve to restore hearing function. Traditional cochlear implants, which come with a disability label and are easily lost, have a poor user experience and hinder daily activities, limiting the widespread adoption of cochlear implants. The greatest advantage of fully implantable cochlear implants is that they completely integrate the traditional external device into the body, making the wearer appear indistinguishable from a normal person. However, if a patient requires a more detailed 3.0T MRI scan, traditional procedures require surgical flap removal to remove the implant magnet. This is not only cumbersome and increases the risk of infection, but also requires the patient to endure the pain of repeated surgeries. The 3.0T MRI-compatible cochlear implant is also compatible with 1.5T MRI scans. The implant functions stably, the patient has no abnormal sensations, and the examination image quality is not substantially disturbed.

According to the World Health Organization, approximately 1.5 billion people worldwide suffer from varying degrees of hearing loss, of which over 60 million have severe or higher hearing loss, and over 10 million people require cochlear implants. However, only 130,000 cochlear implants have been performed in China, leaving the vast majority of hearing-impaired patients untreated. As my country enters an aging population, the

problem of insufficient intervention for hearing loss has become even more prominent. A cochlear implant is a high-tech, active implantable medical device that restores hearing to patients with severe and profound hearing loss. It is the most effective medical device for treating severe sensorineural hearing loss, especially for young children with congenital sensorineural hearing loss. Cochlear implants can effectively address muteness caused by deafness. The increasing prevalence of ear infections and prelingual hearing impairment will drive the continued expansion of market demand.
