The MRI flowmeter is a device for measuring blood flow with a catheter. According to the principle of the pitot tube, when the fluid flows through the catheter, a pressure difference will be generated between the top hole and the side hole of the catheter. This pressure difference corresponds to the flow rate one by one. By measuring the pressure difference to achieves the purpose of measuring blood flow velocity, and the purpose of measuring blood pressure is achieved by measuring the pressure of the side hole. It has the characteristics of non-invasive, high-resolution, multi-parameter analysis and wide application.
