MRI guided drug delivery or magnetic resonance guided drug delivery is a part of an advanced drug delivery system that helps transport a therapeutic agent from the site of administration to the targeted area. High intensity focused ultrasound (HIFU) is a non-invasive and non-ionizing sonic energy-based therapeutic technology for inducing thermal and non-thermal effects in tissues. Depending on the parameters, HIFU can ablate tissues by heating them to $>55\text{ }^{\circ}\text{C}$ to induce denaturation and coagulative necrosis, improve radio- and chemo-sensitizations and local drug delivery from nanoparticles at moderate hyperthermia ($41\text{-}43\text{ }^{\circ}\text{C}$), and mechanically fragment cells using acoustic cavitation (also known as histotripsy). HIFU has already emerged as an attractive modality for treating human & veterinary cancers, infectious diseases, and neuromodulation.

The global MRI Guided Drug Delivery market size is projected to grow from US\$ 110 million in 2024 to US\$ 203 million in 2030; it is expected to grow at a CAGR of 10.7% from 2024 to 2030.
