Abstracts

The global MRI-Guided Linear Accelerator market size is predicted to grow from US$ 92.93 million in 2025 to US$ 174 million in 2032; it is expected to grow at a CAGR of 9.5% from 2026 to 2032.

MRI-Guided Linear Accelerator is a tumor radiotherapy device that highly integrates a magnetic resonance imaging (MRI) system with a medical linear accelerator. Its core principle is to obtain high-resolution magnetic resonance images of patients during treatment in real time, combined with high-energy X-rays or electron beams generated by the linear accelerator, to achieve precise positioning and dynamic tracking of the tumor target area, and support online adaptive radiotherapy plan adjustment; the device uses the soft tissue imaging advantages of MRI to clearly present the anatomical relationship between the tumor and the surrounding normal tissue, and cooperates with hardware designs such as the double-layer dual-focusing multi-leaf collimator (MLC) to accurately control the beam irradiation range and reduce radiation leakage. During the treatment process, the target area position changes can be monitored in real time to ensure that high-dose radiation always covers the tumor area, significantly reducing toxic damage to surrounding organs. It is suitable for stereotactic body radiation therapy (SBRT) of abdominal and soft tissue tumors such as prostate cancer, pancreatic cancer, and breast cancer, and has become a key technological breakthrough in the field of modern precision radiotherapy.

United States market for MRI-Guided Linear Accelerator is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
