The global MRI-Guided Radiation Therapy System market size is predicted to grow from US$ 112 million in 2025 to US$ 202 million in 2032; it is expected to grow at a CAGR of 9.0% from 2026 to 2032.

The MRI-Guided Radiation Therapy System is an innovative tumor radiotherapy device that highly integrates magnetic resonance imaging (MRI) technology with a medical linear accelerator. It takes advantage of MRI's non-radioactivity and high soft tissue contrast resolution to obtain real-time high-resolution images of the patient's tumor and surrounding normal tissue during treatment. It uses online adaptive technology to automatically adjust the target position, shape and irradiation dose according to the dynamic changes in tumor morphology, size and position, achieving millimeter-level precision in soft tissue resolution and real-time tumor tracking, while ensuring that high-dose radiation accurately covers the tumor area while maximally protecting normal tissue. Its technological breakthrough solves the limitations of traditional CT image-guided radiotherapy, such as unclear soft tissue display and inability to track tumor displacement in real time, and provides more personalized and precise treatment plans for complex cases such as prostate cancer, rectal cancer, and brain metastases.

United States market for MRI-Guided Radiation Therapy System is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
