The global mRNA Drug market size is predicted to grow from US\$ 438 million in 2025 to US\$ 620 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

Messenger RNA (mRNA) is a single-stranded long ribonucleic acid that can transmit genetic information in DNA and synthesize proteins through translation. After mRNA enters the body, specific proteins can be expressed by autologous cells, avoiding the influence of in vitro factors; it can regulate the human immune system through endogenous expression of functional proteins, and eliminate autologous threats including cancer cells. The mRNA vaccine encoding the antigenic sequence is introduced into cells through a delivery platform such as lipid nanocarriers, and then human cells produce antigens through translation to activate the immune response.

The global pharmaceutical market is 1475 billion USD in 2022, growing at a CAGR of 5% during the next six years. The pharmaceutical market includes chemical drugs and biological drugs. For biologics is expected to 381 billion USD in 2022. In comparison, the chemical drug market is estimated to increase from 1005 billion in 2018 to 1094 billion U.S. dollars in 2022. The pharmaceutical market factors such as increasing demand for healthcare, technological advancements, and the rising prevalence of chronic diseases, increase in funding from private & government organizations for development of pharmaceutical manufacturing segments and rise in R&D activities for drugs. However, the industry also faces challenges such as stringent regulations, high costs of research and development, and patent expirations. Companies need to continuously innovate and adapt to these challenges to stay competitive in the market and ensure their products reach patients in need. Additionally, the COVID-19 pandemic has highlighted the importance of vaccine development and supply chain management, further emphasizing the need for pharmaceutical companies to be agile and responsive to emerging public health needs.
