The global MT-jumper market size is predicted to grow from US\$ 634 million in 2025 to US\$ 1060 million in 2032; it is expected to grow at a CAGR of 7.8% from 2026 to 2032.

MT patch cords are high-density fiber optic patch cords employing MT multi-core fiber optic connectors, typically corresponding to MPO or MTP interfaces. They integrate 12, 24, or even more fiber optic channels and are primarily used for bulk optical connections between data centers and high-speed optical communication equipment, enabling high-speed, low-loss signal transmission between switches, optical modules, and cabling systems. In 2025, global MT patch cord sales were estimated at approximately 3.6 million kilometers, with an average unit price of approximately US\$180 per kilometer and a capacity utilization rate of approximately 82%. Upstream and downstream companies are involved in fiber optic preform and fiber manufacturing, precision machining of optical connectors and ceramic ferrules, optical communication equipment manufacturing, and data center system integration, with a gross profit margin of approximately 28%. In the product cost structure, fiber optic and connector components account for approximately 45%, precision machining and assembly for approximately 25%, testing and yield losses for approximately 15%, labor and manufacturing costs for approximately 10%, and other costs for approximately 5%. On the demand side, the downstream demand list includes cloud computing data centers, high-speed communication networks, 5G base stations, backbone transmission networks, enterprise-level data centers, supercomputing centers, and military communication systems. The downstream customer list includes telecom operators, cloud computing and internet platform companies, communication equipment manufacturers, government information departments, and military units. On the business opportunity side, policy drivers mainly come from the accelerated development of large-scale optical interconnects driven by the construction of new infrastructure and the deployment of computing power networks. Technological innovation drivers are reflected in the rapid growth in demand for high-density, low-loss connections driven by the widespread

adoption of 800G and above high-speed optical modules, while continuous breakthroughs in automated manufacturing and high-precision optical alignment technologies further drive demand. Changes in consumer demand are manifested in the explosive growth of data traffic, driving the continuous upgrade of networks to higher bandwidth, lower latency, and higher reliability, thus propelling MT patch cords towards high-end and large-scale applications.
