The global MTO/MTP Catalysts market size is predicted to grow from US\$ 390 million in 2025 to US\$ 546 million in 2032; it is expected to grow at a CAGR of 5.0% from 2026 to 2032.

MTO (Methanol-to-Olefins) and MTP (Methanol-to-Propylene) catalysts are specialized catalytic materials, primarily microporous zeolites or silicoaluminophosphates, designed to convert methanol or dimethyl ether into light olefins. These catalysts function through a 'Hydrocarbon Pool' mechanism within their unique pore structures. SAPO-34, with its chabazite (CHA) topology, is the industry standard for MTO due to its high selectivity toward ethylene and propylene. In contrast, ZSM-5 (MFI topology) is predominantly employed for MTP processes, as its medium-pore structure and tunable acidity favor propylene production. Both catalyst types are characterized by high hydrothermal stability and precise shape-selectivity, which are critical for optimizing light olefin yields in coal-to-olefins (CTO) or gas-to-olefins (GTO) industrial chains.

In 2025, global MTO/MTP catalyst production reached 21,000 tons, with an average selling price of USD 19/kg and total production capacity of approximately 25,000 tons. The industry gross margin was around 30%-45%. In terms of cost structure, direct materials accounted for about 55%-65%, manufacturing overhead for about 23%-32%, and labor costs for about 8%-13%. The upstream of the industry chain consists of raw materials such as silicon sources, aluminum sources, phosphorus sources, and templates, while the downstream includes methanol-to-olefins/coal-to-olefins units, methanol-to-propylene units, and further supporting producers of ethylene, propylene, polyethylene, and polypropylene.

The global MTO/MTP catalyst market is defined by diverging regional demand logics. In China, tightening energy efficiency policies are shifting catalyst demand away from new capacity builds and toward upgrades and replacements of existing assets, with energy

performance becoming a rigid selection criterion. North America's ethane cracking advantage keeps MTO/MTP economics uncompetitive, limiting catalyst consumption to niche methanol-to-propylene applications. Europe, driven by carbon border adjustment mechanisms and renewable methanol mandates, is accelerating green methanol-to-olefins demonstration projects, creating demand for catalysts with broad feedstock tolerance and lower carbon footprints that current mainstream portfolios do not yet adequately address. The Middle East leverages low-cost methanol to extend propylene chains, prioritizing propylene selectivity and coking resistance. Southeast Asia and select Belt and Road countries harbor project pipelines that represent potential incremental demand, though realization is constrained by financing and environmental hurdles. China's domestically developed DMTO-III and MTP catalysts now achieve large-scale deployment and export-grade performance, diversifying global supply. The growing international policy focus on sustainable methanol is opening a differentiated innovation space for catalysts compatible with green feedstocks. Across all regions, catalyst solutions delivering lower energy consumption, extended lifetime, and feedstock flexibility will command greater pricing power as low-carbon transitions advance.
