Mulch film degraders refer to a class of chemical or biological agents specifically used to accelerate the decomposition process of mulch film (a plastic covering material widely used in agricultural production). These degraders can accelerate the decomposition process of mulch film through various mechanisms (such as biodegradation, chemical degradation or physical degradation), thereby reducing environmental pollution and damage to soil quality.

The development and application of mulch film degraders are of great significance to reducing plastic pollution, protecting soil quality and promoting sustainable agricultural development. By using mulch film degraders, the residual time of mulch film in farmland can be effectively reduced, reducing its impact on the environment and organisms, while improving agricultural production efficiency and economic benefits.

The global Mulch Film Degrading Agent market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
