A multi-channel signal acquisition analyzer is a device used to acquire, analyze and process multi-channel signals. It usually consists of two parts, hardware and software. The hardware part includes multiple input channels for simultaneous acquisition of multiple signals. These signals can come from different sensors or devices, such as sound, vibration, temperature, pressure, etc. The acquisition analyzer's hardware also includes an analog-to-digital converter (ADC), which converts the analog signal into a digital signal. The software part is the core of the acquisition analyzer, which is used to process and analyze the collected signals. Software usually provides multiple functions, such as data recording, real-time monitoring, spectrum analysis, time domain analysis, frequency domain analysis, filtering, peak detection, etc. Users can visualize, count and report signals through the software, so as to better understand and analyze the characteristics and behavior of signals. Multi-channel signal acquisition analyzers are widely used in various fields, such as engineering monitoring, structural health monitoring, acoustic analysis, vibration analysis, signal processing, experimental research, etc. It can help users monitor and analyze multiple signals in real time, provide data support and decision basis, and help improve product design, fault diagnosis, performance optimization, etc.
