A coaxial cable is an electrical cable with a copper conductor, an insulator shielding around it, and a braided metal mesh that prevents signal interference and cross-talk. Coaxial cable is also known as coax. The core copper conductor is used to transmit signals, and the insulator provides insulation to the copper conductor. The insulator is surrounded by a braided metal conductor, which helps prevent electrical signals'

interference and cross-talk. This entire setup is again coated with a protective plastic layer to provide extra safety to the cable.

The multi-port coaxial connector can connect multiple coaxial lines of up to 67 GHz DC at once via a printed circuit board connector and cable plug. This system uses reliable cables and offers a variety of connectable coaxial connectors. The small pitch allows a smaller footprint for the board. All Coax cables are easy to install and very durable. Because fiber has higher and more rapid data transfer than coax, they are best used for professional networks or multi-dwelling units (MDUs), such as those discovered within a business campus, university, or apartment complex. If the user is working on a home installation or medium-capacity data transfer network, then most would choose to install with a coax cable.
