Inventory optimization is the balancing of investments in stock-keeping units and service goals, while taking into account the volatilities of demand and supply. One of the major challenges a company faces is matching its supply to consumers' demand. How efficiently a company addresses this challenge directly impacts the company's profitability. Working capital being of utmost importance for any company, it is important for companies to keep low levels of stock and sell them quickly. Supply chains today have multiple layers of suppliers and distributors. With each layer adding some safety stock considering service requirements, a significant amount of working capital is involved. Multi echelon inventory optimization approach involves taking a holistic approach toward the entire supply chain and considering the impact inventories have at any given level in the supply chain. It answers where in the supply chain inventories should be placed and optimizing and updating buffer stock at all levels. By effectively modeling the entire supply chain from raw materials to manufacturing and finished goods, multi echelon inventory optimization creates what-if scenarios and explores alternate suppliers, transport links, lead times as well as locations. Levels of safety stocks and postponement strategies having lower cost implications are also verified in the process.
