The global Multi-Effect Solar Stills market size is predicted to grow from US$ 103 million in 2025 to US$ 208 million in 2032; it is expected to grow at a CAGR of 10.8% from 2026 to 2032.

The global Multi-Effect Solar Stills market produces about 28,000 units annually, with a capacity of 40,000 units and an average gross margin of 37%. Unit prices range from USD 800 to 3,500, depending on capacity, from small household models to larger community-scale systems. Multi-Effect Solar Stills are advanced solar desalination systems that use multiple sequential evaporation–condensation stages to maximize the efficiency of converting saline or brackish water into fresh water. In these systems, solar energy heats water in the first stage, producing vapor that condenses on a cooler surface to yield distilled water while releasing latent heat, which is then reused to evaporate water in the next stage at a slightly lower pressure and temperature. The supply chain of Multi-Effect Solar Stills involves sourcing materials like glass, metals, insulation, and coatings, which are manufactured into evaporation-condensation units and integrated with piping, pumps, and sensors. Finished systems are distributed through renewable energy providers, NGOs, and government programs, installed by local contractors, and used by households, communities, and relief organizations for sustainable freshwater production.

United States market for Multi-Effect Solar Stills is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
