The global Multi Layer Blown Film Plant market size is predicted to grow from US\$ 803 million in 2025 to US\$ 1091 million in 2031; it is expected to grow at a CAGR of 5.2% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Multi-layer blown film plant is the core production system in the field of plastic film manufacturing. Through the coordinated work of multiple extruders, polymer melts with different characteristics (such as polyethylene, barrier materials, adhesive layers, etc.) are input into a precision annular die head, layered and compounded under high pressure to form a melt tube embryo, which is then inflated by high-pressure air to form a film bubble. Finally, a functional multi-layer film is made through gradient cooling, pulling flattening and winding.

The global multi-layer blown film plant market continues to grow, mainly driven by the upgrading of demand for high-end packaging materials, the expansion of functional film applications and the trend of sustainable production. With the surge in demand for high-performance films (such as high barrier, puncture-resistant, and degradable composite materials) in the food, medicine, agriculture and industrial fields, multi-layer co-extrusion technology has become the mainstream choice in the industry because it can flexibly combine different resin layers to optimize product performance. In terms of regional markets, the Asia-Pacific region occupies the largest share due to the expansion of the packaging manufacturing industry and consumption upgrades, while the European and American markets focus on equipment technology iteration driven by environmental

regulations (such as recyclable design). Leading equipment manufacturers are strengthening their competitiveness by improving co-extrusion accuracy (7-11 layers), energy efficiency and intelligent control systems, but high initial investment and fluctuations in raw material costs remain market challenges. In the future, circular economy policies and the promotion of bio-based films will further reshape the direction of equipment innovation and promote the market's transformation to green, high-value-added solutions.
