Two-photon excitation microscopy (also referred to as non-linear, multiphoton, or two-photon laser scanning microscopy) is an alternative to confocal and deconvolution microscopy that provides distinct advantages for three-dimensional imaging.

Technological advancements in microscopy have resulted in improved imaging capabilities, resolution, and sensitivity. Innovations such as confocal microscopy, super-resolution imaging, and 3D imaging techniques have enabled researchers to visualize and analyze samples with greater detail and clarity. These advancements drive the demand for advanced microscopy systems. Microscopes play a crucial role in life sciences research, including areas such as biology, medicine, pharmaceuticals, and genetics. The increasing focus on understanding diseases, drug development, and molecular biology drives the demand for microscopes that can provide high-resolution imaging, live-cell imaging, and multimodal imaging capabilities for a wide range of biological samples. The microscope market is witnessing trends such as advancements in imaging technology, growing demand in life sciences research, rise in digital microscopy, integration with other technologies, focus on miniaturization and portability, sustainability initiatives, and integration of automation and robotics. These trends drive the development of innovative and versatile microscope systems to meet the evolving needs of researchers, educators, and professionals across various industries.
