The global Multi-Pole Conductor Bar market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Multi-Pole Conductor Bar are mainly composed of high-strength engineering plastic insulated conduits (or aluminum alloy protective sleeves), multi pole conductive copper bars, current collectors, and components such as suspension and fixation. Among them, the collector is a device that transfers the electrical energy in the sliding wire (conduit) to the electrical equipment through sliding contact. The working principle of a multipole sliding contact line is based on the current transmission generated by the contact friction between the sliding contact line and the collector device. When the sliding contact moves along the sliding rail, current is transmitted through the contact point between the contact and the rail. The power supply generates current through a transformer or generator, transmitting electrical energy to the sliding contact line, and then the current is transmitted to the electrical equipment through the contact point between the sliding contact and the sliding guide rail.
