Coaxial cable is a cable with copper conductors, an insulator shield, and a braided metal mesh to prevent signal interference and crosstalk. Coaxial cable is also known as coaxial cable. The core copper conductor is used to transmit the signal and the insulator provides insulation for the copper conductor. The insulator is surrounded by a braided metal conductor that helps prevent interference and crosstalk of electrical signals. The whole setup is again coated with a protective plastic layer to provide extra security for the cables.

Multi-port coaxial connectors can connect multiple coaxial lines at the same time through printed circuit board connectors and cable plugs. The system uses reliable cables and offers a variety of connectable coaxial connectors. The small pitch allows the board to take up less space. All coaxial cables are easy to install and very durable. Because optical fibers have higher, faster data transmission speeds than coaxial cables, they are best suited for professional networks or multiple dwelling units (MDUs), such as those found in business parks, universities, or apartment complexes. If the user is working on a home installation or a medium capacity data transfer network, then most will choose to use coax for the installation.
