Multi-service intelligent routing switch (MIRS) is a network switch designed to provide intelligent routing for various types of network services. MIRS equipment is used in complex network environment, which needs to effectively route and manage various types of data, voice and video traffic. MIRS devices are usually used in enterprise

networks, data centers and service provider networks to achieve high-speed data transmission between network devices. They can handle various network protocols and support a series of services, such as virtual private network (VPN), quality of service (QoS) and load balancing. MIRS equipment uses advanced routing algorithms to select the best path for each type of traffic based on network congestion, available bandwidth and priority assigned to different types of traffic. This helps optimize network performance and ensures that critical network traffic has the highest priority. MIRS devices usually also include advanced security features to prevent threats such as denial of service attacks, malware and unauthorized access. They can provide remote users with secure access to the network through VPN and support authentication protocols.
