The global Multi-wire Spring market size is predicted to grow from US\$ 1321 million in 2025 to US\$ 1875 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

Multi-wire spring is a special type of spring made by first twisting multiple strands of steel wire into a cable and then coiling them. Their core function is to generate a damping effect through the contact friction between the individual strands of steel wire when subjected to impact and vibration, achieving excellent vibration absorption and reduction. They solve the problems of insufficient damping performance and short fatigue life of single-strand springs under heavy loads and high-frequency impact conditions, and are widely used in key areas such as aero-engines, automatic weapon recoil mechanisms, and high-precision vibration reduction systems. The upstream supply chain mainly includes special steel wire materials (high-strength carbon spring steel wire), precision CNC machining equipment (multi-axis linkage multi-strand spring machine tools), and tension control and heat treatment processes; the downstream market targets defense and military industries (weapon recoil springs, aero-engine valve springs), high-end equipment manufacturing (heavy machinery shock absorbers, vibration equipment), and transportation (automobile and motorcycle vibration reduction systems). In 2025, the production of multi-wire springs is estimated at approximately 900 million units, with an average price of approximately US\$1.5 per unit, a gross profit margin of approximately 30%, and a single-line capacity of 9 million units per year.

United States market for Multi-wire Spring is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
