The global Multiaxis Machining market size is predicted to grow from US\$ 15860 million in 2025 to US\$ 27080 million in 2032; it is expected to grow at a CAGR of 8.1% from 2026 to 2032.

Multiaxis machining refers to the capability of a computer numerical control (CNC) machine tool to move a cutting tool or workpiece along multiple axes simultaneously. Traditional machining typically involves movement along three axes (X, Y, and Z), but multiaxis machining extends this capability to include additional rotational movements around one or more of these axes.

The development of multi-axis machining is primarily driven by the increasing demand for high-precision, complex parts in the manufacturing industry, as well as the automation and intelligent production driven by Industry 4.0. With the growing demand for lightweight, high-strength and complex geometric parts in industries such as aerospace and automotive manufacturing, traditional machine tools are unable to meet complex processing requirements. Multi-axis machining can complete multi-faceted processing in one clamping, significantly improving production efficiency and processing accuracy. With technological advancements and evolving societal needs, multi-axis machining is developing towards greater intelligence, efficiency, and versatility, playing a key role globally, particularly in high-end manufacturing.
