The global Multicolor Laser Photocoagulator market size is predicted to grow from US\$ 59.58 million in 2025 to US\$ 94.20 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

A multicolor laser photocoagulator is an ophthalmic medical laser device that delivers multiple laser wavelengths?such as 532 nm, 577 nm, and 810 nm?to perform selective photocoagulation of retinal or choroidal tissues. Different wavelengths correspond to distinct tissue absorption characteristics, enabling precise energy delivery for conditions such as vascular lesions, macular edema, and diabetic retinopathy. The core structure typically includes multi-wavelength laser source modules, an energy control system, optical delivery and coupling systems, a slit-lamp or microscopic observation system, and safety control modules.

Upstream includes semiconductor or solid-state laser modules, precision optical lenses and coated components, fiber coupling assemblies, power control circuits, and precision mechanical structures. Downstream applications include hospital ophthalmology departments, specialized eye hospitals, and retinal treatment centers. The overall industry gross margin generally ranges from 50% to 70%, with higher margins for integrated multi-wavelength and digitally scanned systems.

United States market for Multicolor Laser Photocoagulator is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
