A ventilator is a medical device that can effectively replace, control or change a person's normal physiological breathing, increase lung ventilation, improve respiratory function, reduce respiratory consumption, and save cardiac reserves. It can provide breathing and mechanical ventilation for patients who are physiologically unable to breathe or have insufficient breathing. Modern ventilators are computer controlled, but patients can also be breathed using a simple manual bag-valve resuscitation ball. Ventilators are mainly used in critical care medicine, home care and emergency medicine (as a stand-alone device) and in anesthesiology (as an integral part of an anesthesia machine).

In modern clinical medicine, ventilators, as an effective means of artificially replacing autonomous ventilation function, have been widely used in respiratory failure caused by various causes, anesthesia respiratory management during major surgery, respiratory support treatment and emergency resuscitation. It occupies a very important position in the field of modern medicine. The ventilator is a vital medical equipment that can prevent and treat respiratory failure, reduce complications, and save and extend the patient's life.

The global Multifunctional Electric Electronically Controlled Therapeutic Ventilator market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
