Multifunctional protein stability analysis systems are specialized analytical instruments used to evaluate the stability of proteins, antibodies, vaccines, recombinant proteins, enzymes, and other biomolecules under thermal, chemical, formulation, storage, and process stress conditions. They typically utilize techniques such as intrinsic differential scanning fluoroscopy, DLS, and SLS to detect protein thermal stability, conformational changes, aggregation tendency, particle size distribution, colloidal stability, and formulation suitability. They are primarily used in antibody drug and biologic candidate screening, protein formulation development, biosimilar comparability studies, protein engineering, vaccine antigens, diagnostic proteins, and scientific research experiments. The upstream of the industry chain includes optical components, lasers, fluorescence detectors, temperature control modules, microplates, capillaries, software algorithms, and precision mechanical parts; the midstream consists of manufacturers; and the downstream mainly comprises biopharmaceutical companies, universities, and research institutions. Gross profit margins range from approximately 40% to 65%.
