The global MultiJet Modeling (MJM) 3D Printers market size is predicted to grow from US\$ 1078 million in 2025 to US\$ 1982 million in 2031; it is expected to grow at a CAGR of 10.7% from 2025 to 2031.

A multi-jet modeling 3D printer ejects a liquid material, which then solidifies as it cools. They are equipped with multiple print heads, one of which is used to manufacture a material (such as wax) at the same time as the part. The material is sprayed layer by layer and molded by chemical resin, hot melt material and light curing. Build high-accuracy, high-definition models and prototypes for proof-of-concept, functional testing, prototyping of molds, direct investment casting. The parts produced are very precise and can be made from a variety of materials depending on the number of print heads. The technology is particularly suitable for jewelry making and mold making.

The industrial printer segment leads the market, accounting for more than 76.0% of the global revenue share in 2022. Based on printer type, the industry is further segmented into industrial printers and desktop 3D printers. The huge share of industrial 3D printers can be attributed to the widespread adoption of industrial printers in heavy industries such as automotive, electronics, aerospace and defense, and healthcare. Prototyping, design and tooling are the most common industrial applications in these verticals. 3D printing benefits manufacturers in terms of prototyping, structural and final product design, modeling and time to market. As a result, production costs are greatly reduced and manufacturers are able to offer better products at reasonable prices. Owing to these advantages, the demand for 3D printers is expected to further increase in the coming years. Widespread adoption of 3D printing in prototyping, design, and mold

making is driving growing demand in the industrial sector. Hence, the industrial printer segment is expected to continue to dominate during the forecast period. The adoption of desktop 3D printers was initially limited to hobbyists and small businesses. Today, however, they are increasingly used for home and household purposes. The education sector including schools, educational institutions, and universities are also deploying desktop printers for technical training and research purposes. Small businesses in particular are adopting desktop printers and diversifying their operations to provide 3D printing and other related services. For example, the concept of 'fabshops' is gaining popularity in the United States. These fabshops provide on-demand 3D printing of parts based on designs and requirements provided by customers. Hence, the demand for desktop printers is expected to witness substantial growth over the forecast period.
