The global Multilayer Adhesive Film market size is predicted to grow from US\$ 548 million in 2025 to US\$ 741 million in 2032; it is expected to grow at a CAGR of 4.6% from 2026 to 2032.

Multilayer adhesive film is a family of thermoplastic bonding films engineered to provide controlled adhesion, structural integrity, and sealing or barrier performance in laminates and composite structures. Instead of applying liquid glues, converters use these films as solid, pre-metered adhesive layers that are activated by heat and pressure, enabling clean processing, precise coat weight, and tightly controlled thickness on textiles, foams, plastics, metals, and paper substrates.

Upstream, supply is anchored by TPU, co-polyamide, co-polyester, EVA and polyolefin resin producers, together with compounding capabilities that tune melting behavior, crystallization speed, and rheology. Film makers then cast or coextrude single and multilayer constructions, often adding release liners or functional outer skins. Downstream, key user groups are automotive and transportation tiers, technical textiles and footwear brands, electronics and electrical component makers, building and construction laminators, and selected medical and hygiene customers. Procurement is usually based on qualification followed by annual or multi-year agreements rather than spot purchasing, because lamination windows, line conditions, and end-product testing are all sensitive to film formulation. At the material-only level, typical gross margins for multilayer adhesive film are around 30 percent, supported by formulation know-how, demanding quality requirements, long customer qualification cycles, and strong lock-in once a film is designed into an OEM platform.

In the current market, global production is around 80 kt, with an average selling price of

about 7000 USD per t on an EXW basis. The supply side combines a small number of global technology leaders with a long tail of regional specialists. At the global end, Covestro's Platilon adhesive films and the Pontacol portfolio, Bostik together with Prochimir and Protechnic, Toray's structural film adhesives, and ZACROS Meta Seal Film are widely used in automotive, electronics, and high-reliability laminates.

Looking ahead, demand growth for multilayer adhesive film is expected to be driven by several overlapping themes rather than a single trigger. Automotive and transportation applications are shifting from liquid adhesive systems toward thermoplastic films to support lightweight multi-material designs, cleaner cabin air, and more automation-friendly lamination. Electronics and medical users are pushing toward thinner, cleaner, and more reliable bonding layers in flexible displays, wearables, sensors, and medical textiles, which favors high-spec TPU, co-polyamide, and co-polyester films with tight thickness tolerances and low volatile content. At the same time, decarbonization and sustainability policies encourage solvent-free, low-VOC, and recyclable structures; coextruded adhesive films designed for mono-material laminates or easier delamination clearly benefit from this direction. On the constraint side, capital-intensive casting and coextrusion lines, lengthy customer qualification cycles, and the need for robust quality and regulatory systems act as meaningful entry barriers, while access to specialty polymers and additives can be tight for low-yellowing, hydrolysis-resistant, or medical-grade chemistries. Some established suppliers are experimenting with AI-assisted formulation and process optimization to shorten development cycles, better predict bonding performance across substrates, and reduce trial-and-error on production lines, but this is still an early-stage practice.
