The global Multilayer Ceramic Varistor market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Multilayer ceramic varistors (MLV) are electronic components used for circuit protection. They are made of multiple varistors stacked together, usually using zinc oxide (ZnO) as the main material. Its working principle is based on nonlinear resistance characteristics. When overvoltage or transient voltage appears in the circuit, the multilayer ceramic varistor can respond quickly and absorb and disperse the voltage spike by providing a low impedance path, thereby protecting other circuit components from electrical interference and damage. Due to its good electrical performance and reliability, multilayer ceramic varistors are widely used in overvoltage protection in consumer electronics, home appliances, power systems, automotive electronics, communication equipment and other fields.

As an important circuit protection component, multilayer ceramic varistors (MLVs) play a key role in modern electronic devices. They can quickly respond to voltage spikes and effectively absorb overvoltages, protecting sensitive electronic components from damage. They are an effective means of preventing equipment failures and extending service life. As the complexity and power density of electronic devices continue to increase, the demand for overvoltage protection is also growing. The high response speed and excellent voltage-sensitive performance of multilayer ceramic varistors make them an indispensable protection solution in various applications. Whether it is consumer electronics, automotive electronics or industrial control systems, the application of MLVs has significantly improved the reliability and safety of equipment, reflecting its wide applicability and importance in modern technology.
