The global Multiparametric In-vitro Cardiotoxicity Testing market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Multiparametric In-vitro Cardiotoxicity Testing refers to a set of laboratory-based techniques and assays used to evaluate the potential toxic effects of drugs, chemicals, or other substances on the cardiovascular system. It involves the assessment of multiple parameters or endpoints to comprehensively evaluate the cardiac safety profile of a substance.

As the demands of drug development and chemical evaluation increase, the need for cardiotoxicity testing is also growing. Traditional animal testing methods have limitations such as high cost, long time, and ethical and moral issues, while Multiparametric in-vitro cardiotoxicity testing provides an alternative. By using cardiac cells, tissues or models, combined with multi-parameter measurements, it can more accurately evaluate the toxic effects of compounds on the heart, thereby improving the efficiency of drug safety assessment and chemical screening.
