Multiphase wellhead gas desander is a device used in the oil and gas industry to remove solid particles, such as sand or other abrasive impurities, from the raw gas produced at the wellhead. The desander is typically installed near the wellhead and functions by creating a cyclonic flow pattern that separates and removes the solid particles from the gas stream. This helps protect downstream equipment, such as pipelines and processing facilities, from erosion and damage caused by abrasive particles. The multiphase wellhead gas desander improves the efficiency and reliability of gas production operations while reducing maintenance requirements.
