The global Multiphoton Microscopy market size is predicted to grow from US\$ 222 million in 2025 to US\$ 296 million in 2031; it is expected to grow at a CAGR of 4.9% from 2025 to 2031.

Multiphoton microscopy (MPM) is an imaging technique that allows intact biological samples to be visualized at high resolution. MPM is based on nonlinear optical processes such as two-photon and three-photon excited fluorescence (2PEF, 3PEF) and second and third harmonic generation (SHG, THG) (see figure 1 below). Most commonly, 2PEF and 3PEF are used to image fluorescent dyes or endogenous molecules. SHG is used to image non-centrosymmetric structures such as collagen fibers and THG is used to visualize the refractive index differences such as the interface of lipid droplets.

Market competition is intense. Bruker, Leica, Carl Zeiss, Olympus, Nikon, etc. are the leaders of the industry, and they hold key technologies and patents, with high-end customers. Top 5 manufacturers accounted for 70% market share in 2019.
