## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Single microinverters in the industry can only connect one component, and because they cannot share internal circuits, they have problems such as low integration and high cost per watt. Through the innovation of circuit design and control algorithm, multiple components are used for independent input, sharing the main control module, communication module, DC-DC module, DC-AC module, etc., while ensuring the working synergy of multiple components after independent input, and significantly reducing the number of components. The usage quantity improves product integration, reliability and installation efficiency, and reduces the cost per watt.

The global Multiple-Input Micro Inverter market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
