Multiplex PCR, also known as multiplex primer PCR or multiplex PCR, is a PCR reaction in which more than two pairs of primers are added to the same PCR reaction system, and at the same time, multiple nucleic acid fragments are amplified. The Reaction Reagent and the operation process are the same as the ordinary PCR. In general, PCR only uses a pair of primers and produces a nucleic acid fragment by PCR amplification, which is mainly used for the identification of single pathogenic factor. Multiplex PCR is mainly used to detect and identify some pathogenic microorganisms, some genetic diseases and genotyping of oncogenes.
