The global Multiplexed Analog-to-digital Converter market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Multiplexing analog-to-digital converter (ADC) is an electronic device that converts analog signals into digital signals. It operates by sampling multiple analog input signals at one time and converting them into digital signals. This process is completed using a multiplexer, which selects the input signal to be converted and connects it to the ADC. Multiplexers usually have multiple inputs, allowing ADC to convert multiple analog signals with a single conversion process. The converted digital signal is then sent to the microcontroller or other digital processing unit for further processing or storage. One advantage of multiplexing ADC is that it can reduce the number of ADC required by a given application, thus reducing the system cost and complexity. However, compared with dedicated ADC, multiplexed ADC usually has a slower conversion rate, which may be a limiting factor in applications requiring high-speed signal acquisition.

United States market for Multiplexed Analog-to-digital Converter is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Multiplexed Analog-to-digital Converter is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for Multiplexed Analog-to-digital Converter is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
